Efficiency; Monopoly - indeterminacy of rate of return.

The indeterminacy of the AC curve level is related to the indeterminacy of the overhead element. Given the equilibrium positive rate of return, we have the following relations:

average price given by  
 $OB$ .  $OA$  average  
 variable cost; the amount  
 $ab$  is equal to the fixed

cost element which includes the overhead elements, and the return on capital. If the firm's management pursues a fixed dividend policy the dividend can be added to  $VC$  to give a SRACD. The management then is in a position to utilize the amount  $a'B$  per unit for what it will - in particular a growth of the bureaucracy, of the overhead items. For example if the  $OC$  curve falls

The firm may as its first reaction increase 'efficiency' by moving  $\downarrow$  cost overhead. Under a competitive system, where the normal rate is the minimum rate which would hold capital to the firm - the amount which can be spent on 'overhead'

factor is strictly presented - the choice is

not between a superior return investment and ~~investment~~

even larger return on investment but between ~~having~~ the having capital in the field at all. The

analysis of monopoly on the basis of returns to capital investment is meaningless without deflating the overhead cost items to the 'minimum' possible.

The freedom of the monopolist to use more factors to produce given output at the expense of return on capital makes the earned return meaningless

in terms of the proof as to whether or not monopoly exists. The

Carrying of extra personnel, the  
~~extra~~ many prudent & wise which  
do not pay their way, even that of  
subsidizing research are alternative  
ways of using the gap between the  
earned rate and the minimum  
cost + dividend rate. This effect of  
monopoly, the elimination of stringent  
standards of efficiency - of forcing the  
firm to use minimum cost combinations  
cannot be eliminated by any doctrine  
of 'workable competition'. The efficiency  
criterion of competition: Be efficient in terms of  
'minimum cost combinations' or get out  
is eliminated due to the speed ability  
of the entrepreneur to cut the rate of  
return on capital. ~~The amount of reputation~~  
~~in business is greater than~~. The bureaucracy  
in a giant corporation sees no need to  
distribute its earnings to the stockholders and  
sees no need to 'earn' more than the  
minimum necessary - cost and  
expandable. The economic system must  
set a standard of efficiency - and the  
non-competitive elements allow the standard to be very low.
